

- P-N-P Inputs and 3-State Outputs Maximize I/O and Data Bus Capabilities
- Data Latch Transparency Permits Asynchronous or Latched Receiver Modes
- Mode and Select Inputs Permit Storing With Outputs Enabled or Disabled
- Strobe-Controlled Flag Flip-Flop Indicates Status or Interrupt
- Asynchronous Clear Sets All Eight Data Lines Low and Initializes Status Flag
- High-Level Output Voltage, Typically 4 V, Drives Most MOS Functions Directly
- Direct Replacement for Intel 3212 or 8212

SN54S412...J PACKAGE
SN74S412...J OR N PACKAGE
(TOP VIEW)

description

This high-performance eight-bit parallel expandable buffer register incorporates package and mode selection inputs and an edge-triggered status flip-flop designed specifically for implementing bus-organized input/output ports. The three-state data outputs can be connected to a common data bus and controlled from the appropriate select inputs to receive or transmit data. An integral status flip-flop provides package busy or request interrupt commands. The outputs, with a 4-volt typical high-level voltage, are compatible for driving low-threshold MOS directly.

DATA LATCHES

The eight data latches are fully transparent when the internal gate enable, G, input is high and the outputs are enabled (OE = H). Latch transparency is selected by the mode control (M), select (S1 and S2), and the strobe (STB) inputs and during transparency each data output (DO_i) follows its respective data input (DI_i). This mode of operation can be terminated by clearing, de-selecting, or holding the data latches. See data latches function table.

MODE SELECTION

An input mode or an output mode is selectable from this single input line. In the input mode, MD = L, the eight data latch inputs are enabled when the strobe is high regardless of device selection. If selected during an input mode, the outputs will follow the data inputs. When the strobe input is taken low, the latches will store the most-recently setup data.

In the output mode, M = H, the output buffers are enabled regardless of any other control input. During the output mode the content of the register is under control of the select (S1 and S2) inputs. See data latches function table.

STATUS FLIP-FLOP

The status flip-flop provides a low-level output signal when:

- the package is selected
- a strobe input is received.

This status signal can be used to indicate that the register is busy or to initiate an interrupt type command.
